

Appendix:

Table from the original SIMPSON paper (M. Bak, J. T. Rasmussen, and N. C. Nielsen, *J. Magn. Reson.* **147** (2000) 296) introducing the basic elements of a SIMPSON input file.

TABLE 2
Elements of and Scripting Commands for the SIMPSON Input File^a

Elements of the SIMPSON input file	
<code>spinsys { . . . }</code>	Spin system and interactions.
<code>par { . . . }</code>	Global experiment parameters.
<code>proc pulseseq {} { . . . }</code>	Pulse sequence.
<code>proc main {} { . . . }</code>	Processing control.
Declarations for the <code>spinsys</code> section	
<code>channels $N_1 N_2 \dots N_n$</code>	
<code>nuclei $N_1 N_2 \dots N_n$</code>	
<code>shift $i \delta_{iso}^i \omega_i^i/2\pi ^b \delta_{min}^i \omega_i^i/2\pi ^b \eta^{CS} \alpha_{PC} \beta_{PC} \gamma_{PC}$</code>	
<code>dipole $i j b_{ij}/2\pi \alpha_{PC} \beta_{PC} \gamma_{PC}$</code>	
<code>jcoupling $i j J_{iso}^i J_{min}^i \eta^J \alpha_{PC} \beta_{PC} \gamma_{PC}$</code>	
<code>quadrupole $i order^c C_Q/2\pi \eta^Q \alpha_{PC} \beta_{PC} \gamma_{PC}$</code>	
Parameters/commands for the <code>par</code> section	
<code>spin_rate</code>	Sample spinning frequency, $\omega_s/2\pi$
<code>np</code>	Number of sampling points.
<code>ni</code>	Number of sampling points in the indirect dimension of 2D experiments.
<code>sw</code>	Spectral width.
<code>swl</code>	Spectral width for the indirect dimension.
<code>crystal_file</code>	Name of the powder averaging file containing the number N of orientations and $\alpha_{CR}^k, \beta_{CR}^k, \omega_k$ values on successive lines.
<code>gamma_angles</code>	Number M of γ_{CR} angles. Set to 1 if <code>spin_rate</code> is zero. Defines the number of sampling points per rotor period when method equals <code>gcompute</code> .
<code>gamma_zero</code>	Constant value added to all γ_{CR} values in the powder averaging. Specifies the γ_{CR} angle if only a single crystallite is used.
<code>rotor_angle</code>	Angle between the rotor axis and the B_0 direction. If <code>spin_rate</code> is zero the default angle is zero, otherwise the magic angle.
<code>method</code>	Chooses among <code>direct</code> , <code>gammarep</code> , and <code>gcompute</code> methods for the simulation.
<code>start_operator</code>	$\rho(0)$ defined as an expression using operators $I\alpha$ where α is $x, y, z, p (+)$ or $m (-)$, and i is the nucleus number or n to denote the sum over all nuclei. ^d
<code>detect_operator</code>	Detection operator Q_{det} . ^d
<code>pulse_sequence</code>	Sets another name than <code>pulseseq</code> for the pulse sequence.
<code>proton_frequency</code>	Absolute ¹ H Larmor frequency $ \omega_H^0/2\pi $ in hertz. Used for ppm to hertz conversion and for the second-order quadrupolar coupling.
<code>verbose</code>	A row of flags that sets the level of information printed when running the simulation.
<code>variable name</code>	Sets a user specific variable with a value that can be retrieved throughout the input file by declaring: <code>\$par(name)</code> .
Commands for the <code>pulseseq</code> section.	
<code>pulse $\delta t \omega_{RF}^1/2\pi \phi_1 \omega_{RF}^2/2\pi \phi_2 \dots$</code>	Extends the current propagator to include a pulse of duration δt , RF-field amplitude of $\omega_{RF}^i/2\pi$, and phase ϕ_i on the channels numbered successively. Alternatively the phase can be specified as $x, y, -x$, or $-y$ corresponding to phases of 0, 90, 180, or 270 degrees, respectively.
<code>pulseid $\delta t \omega_{RF}^1/2\pi \phi_1 \omega_{RF}^2/2\pi \phi_2 \dots$</code>	Same as <code>pulse</code> but performs an ideal (i.e., infinitely strong and infinitely short) pulse. δt and $\omega_{RF}^i/2\pi$ have no physical meaning other than to specify the flip-angle of the pulse. The internal time remains unchanged.
<code>delay δt</code>	Extends the current propagator to include a free precession period of duration δt . If the Hamiltonian is diagonal (i.e., no homonuclear spin-spin couplings) the delay is calculated by analytical integration of the Hamiltonian.
<code>offset $\omega_{off}^1/2\pi \omega_{off}^2/2\pi \dots$</code>	Invokes an offset of $\omega_{off}^i/2\pi$ Hz to the channels numbered successively. The offset for a channel is defined by the Hamiltonian $\omega_{off}^i \sum_j I_{jz}$, where j is summed over the nuclei in the spin-system affected by pulses on the channel. The offset applies until reset using <code>offset</code> with zero-value arguments or the pulse sequence is called again.
<code>acq [$n prop$] [ϕ]</code>	Propagates $\rho(t)$ using the current propagator, collects a data point corresponding to Q_{det} , and resets the propagator to unity. The optional arguments n and $prop$ specifies the number of data points n to collect while evolving with propagator number $prop$. The optional argument ϕ specifies the receiver phase (syntax as for <code>pulse</code>).
<code>maxdt Δt</code>	Maximum time step (Δt in Eq. [4]) over which the Hamiltonian may be considered time independent. The computation time/accuracy of the simulation is significantly affected by the choice of value for this parameter. Defaults to 1 μs in case of sample spinning and infinity in the static case.

TABLE 2—Continued

<code>store <i>n</i></code>	Stores the current propagator in memory slot number <i>n</i> . The current propagator is not reset.
<code>reset [<i>δt</i>]</code>	Resets $\rho(t)$ to the initial operator $\rho(0)$ and the current propagator to the unity operator. Resets the current time and adds δt μ s if specified.
<code>prop <i>n</i> [<i>times</i>]</code>	Propagates $\rho(t)$ with the propagator saved in memory slot number <i>n</i> . Repeated multiple times if <i>times</i> is specified, skipped if <i>times</i> is zero, or propagated once if <i>times</i> is omitted.
<code>filter <i>n</i></code>	Propagates $\rho(t)$ with the current propagator, after which the propagator is reset and elements in the density matrix are set to zero if the corresponding element in matrix number <i>n</i> (defined using <code>matrix set</code>) is zero.
<code>select <i>n</i> ...</code>	Renders the next pulse (pulse or pulseid) selective toward the spins which numbers are given as argument.
<code>turnoff <i>int</i> ...</code>	Disables the effect of the specified interactions until the end of the pulse sequence or until they are reactivated by <code>turnon</code> . Interactions are named <i>int_n</i> or <i>int_n_m</i> using names and numbers given in the <code>spinsys</code> section, or all if all interactions should be disabled.
<code>turnon <i>int</i> ...</code>	Enables the specified interactions or all interactions if <code>all</code> is specified.
<code><i>int</i> getinteractions</code>	Returns a list of lists each containing an interaction name (see <code>turnoff</code>) and 1 or 0 depending on whether it is enabled or disabled.
<code>putmatrix <i>matrix</i> ?<i>format</i>?</code>	Prints out a matrix returned by <code>matrix get</code> optionally in a format different from the standard format “%9.3g”.
<code>matrix set to from</code>	Sets a matrix <i>to</i> to the contents of a matrix created using the argument <i>from</i> described below. <i>to</i> can either be an index in the internal array of matrices, the start (<code>start</code>) or the detect (<code>detect</code>) operator.
<code>matrix <i>matrix</i> get from</code>	Returns a matrix (printed with <code>putmatrix</code>) based on the argument <i>from</i> which can be either the same as <i>to</i> described above or the Hamiltonian (<code>hamiltonian</code>), current propagator (<code>propagator</code>), current density operator (<code>density</code>), an operator expression (<code>operator <i>expr</i></code>) or for the purpose of filtering (undesired elements set to zero) the specific total coherence orders (<code>totalcoherence (. . .)</code>) with the list containing coherences), coherence orders (<code>coherence [(. . .) . . .]</code>) with each sublist containing coherence orders for each nuclei, the full matrix (<code>list {row row . . .}</code>) where each row is a list of elements being either <i>re</i> or <i>{re im}</i>), specific matrix elements (<code>elements {{i j} ...}</code>), or all elements excluding specific matrix elements (<code>notelements {{i j} ...}</code>).

Commands for the main section

<code>d fsimpson [{{<i>int_n_nam</i> <i>v</i>} ...}]</code>	Starts a simulation and returns a data set <i>d</i> , optionally overriding specific values of the interactions given in the <code>spinsys</code> section. A value is named <i>int_n_nam</i> or <i>int_n_m_nam</i> , where <i>int</i> is the interaction name from <code>spinsys</code> , <i>n</i> and/or <i>m</i> the numbers of the involved nuclei, and <i>nam</i> is <code>iso</code> , <code>aniso</code> , <code>eta</code> , <code>alpha</code> , <code>beta</code> , or <code>gamma</code> .
<code>fsave <i>d</i> file [-<i>format</i> -binary -double]</code>	Saves the (possibly 2D) data set <i>d</i> to a file <i>file</i> using the SIMPSON data format in text, binary (<code>-binary</code>) single or double (<code>-double</code>) precision format, or optionally in another format (<code>-format</code>) being (1) <code>-xreim</code> with rows of frequency/time, real and imaginary part of data, (2) <code>-xyreim</code> (2D data) with rows of frequency/time (indirect dimension), frequency/time (direct dimension), real and imaginary part of data, with an empty line separating succeeding fids, or (3) <code>-gnu2d -binary</code> in the binary 2D Gnuplot format (56).
<code>fft <i>d</i> [-inv]</code>	
<code>fft <i>d</i> <i>rp</i> <i>lp</i> <i>rp1</i> <i>lp1</i> [-phsens]</code>	The first form performs a direct or inverse fast Fourier transformation of the data set <i>d</i> , while the second form performs a 2D transformation using constant (<i>rp</i>) and linear (<i>lp</i>) phase correction in the direct and indirect (<i>rp1</i> and <i>lp1</i>) dimensions. The optional argument <code>-phsens</code> assumes phase-sensitive 2D data with succeeding pairs of fids corresponding to equal t_1 and 90° different phase.
<code>fzerofill <i>d</i> <i>npz</i> [<i>niz</i>]</code>	Zerofills the data set <i>d</i> up to a total of <i>npz</i> points, optionally zerofills the 2D data set up to a total of <i>niz</i> points in the indirect dimension.
<code>fphase <i>d</i> [-<i>rp</i> <i>v</i> -<i>lp</i> <i>v</i> -<i>scale</i> <i>v</i> -<i>offset</i> <i>v</i>]</code>	Performs one or more of first- and second-order phasing vertical scaling, and offset on the data set <i>d</i> .
<code>faddlb <i>d</i> <i>lb</i> <i>r</i> [<i>lb1</i> <i>r1</i> [-phsens]]</code>	Apodizes the data set <i>d</i> with a Gaussian/Lorentzian (ratio <i>r</i>) weighting function causing an extra linebroadening of <i>lb</i> Hz, or optionally the 2D data set with <i>lb1</i> and <i>r1</i> specifying the values for the indirect dimension. The optional argument <code>-phsens</code> assumes phase-sensitive 2D data.
<code>fbc <i>d</i> order {{<i>from</i> <i>to</i>} ...} [<i>skip</i>]</code>	Baseline corrects the data set <i>d</i> by fitting every <i>skip</i> (default 1) data point of the baseline in the defined frequency ranges to a polynomial of order <i>order</i> .
<code>fnewnp <i>d</i> points</code>	Changes the number of data points in the data set <i>d</i> . Intermediate points are interpolated using a cubic spline.
<code>fsmooth <i>d</i> points order</code>	Smoothing of the data set <i>d</i> to a given order <i>order</i> .

TABLE 2—Continued

<code>peaks ffindpeaks <i>d</i> <i>th</i> <i>sens</i> [<i>from to</i>]</code>	Finds all peaks in the data set <i>d</i> that are higher than <i>th</i> and spans at least <i>sens</i> data points (optionally restricted to searching inside a specific frequency range) and returns a list of frequencies and peak heights.
<code>areas fint <i>d</i> {<i>from1 to1</i>} {<i>from2 to2</i>}...</code>	Returns a list of integrated intensities (by summation) for the specified spectral regions in the data set <i>d</i> .
<code>areas fssbint <i>d</i> <i>dny</i> <i>shift</i> <i>width</i></code>	Returns a list of integrated intensities (by summation) for equidistant spectral regions (separated by <i>dny</i> Hz, centered around <i>shift</i> Hz, and each having a width of <i>width</i>) in the data set <i>d</i> .
<code><i>d</i> fdup <i>s</i></code>	Copies the data set <i>s</i> to a new dataset <i>d</i> .
<code>fcopy <i>d</i> <i>s</i></code>	Copies the data set <i>s</i> into an existing data set <i>d</i> .
<code>fadd <i>d</i> <i>s</i></code>	Adds the data sets <i>s</i> and <i>d</i> and saves the result in <i>d</i> .
<code>fsub <i>d</i> <i>s</i></code>	Subtracts the data set <i>s</i> from <i>d</i> and saves the result in <i>d</i> .
<code>frev <i>d</i></code>	Reverses the order of all data points in the data set <i>d</i> .
<code>rms frms <i>d1</i> <i>d2</i> [-re -im] [{<i>from to</i>}...]</code>	Returns the normalized root-means-square deviation between the complex, real, or imaginary part of two data sets <i>d1</i> and <i>d2</i> , optionally within specific frequency ranges.
<code>fextract <i>d</i> <i>from to</i></code>	Shrinks the data set <i>d</i> to the specified frequency range.
<code><i>d</i> fzero [{<i>from to</i>}...]</code>	Attributes zero intensity to frequency regions (or the full region) of the data set <i>d</i> .
<code>areas faddpeaks <i>d</i> <i>cutoff</i> {<i>freq int lb r</i>}... }</code>	Adds a series of peaks to the data set <i>d</i> , each of which is specified by a frequency, intensity, additional linebroadening, and Gauss/Lorentz ratio. The areas of the peaks are returned as a list. The <i>cutoff</i> parameter defines the minimum intensity calculated before it is truncated to zero.
<code>fexpr <i>d</i> <i>reexpr</i> <i>imexpr</i></code>	Applies Tcl expressions to the real and imaginary part of each data point in the data set <i>d</i> . Valid variables are the real part of the complex data point <code>\$re</code> , the imaginary part <code>\$im</code> , and the point index <code>\$i</code> starting from one. These variables must be preceded with a backslash if a local variable (<code>\$ac</code>) is used, e.g., <code>fexpr \$f [list \re*\$fac] {\$im+\$i*1.23}</code> .
<code>v findex <i>d</i> <i>i</i> [-re -im]</code>	Returns the real and/or the imaginary part of the <i>i</i> th complex data point in a data set <i>d</i> .
<code>fsetindex <i>d</i> <i>i</i> <i>re</i> <i>im</i></code>	Sets the real and imaginary part of the <i>i</i> th complex data point in the data set <i>d</i> .
<code>v fx <i>d</i> <i>i</i></code>	Returns the frequency or time of a data point <i>i</i> depending on the type of the data set <i>d</i> .
<code><i>d</i> fload <i>file</i></code>	Loads the data set <i>d</i> from a <i>file</i> and returns a data descriptor.
<code>funload [<i>d</i>]</code>	Removes all or a specific data set <i>d</i> from the memory.
<code><i>d</i> fcreate -np <i>v</i> -sw <i>v</i> [-ref <i>v</i> -ni <i>v</i> -swl <i>v</i> -refl <i>v</i> -type <i>v</i>]</code>	Creates and returns a descriptor to the new data set <i>d</i> with zero points and with specifications corresponding the arguments of which <code>-np</code> and <code>-sw</code> are required and <i>v</i> for <code>-type</code> is either <code>fid</code> or <code>spe</code> .
<code>v fget <i>d</i> [-ref -refl -sw -swl -np -ni -type]</code>	Returns either the reference line, spectral width, number of complex data points, or type of data (<code>fid</code> or <code>spe</code>) from the data set <i>d</i> depending on the argument.
<code>fset <i>d</i> [-ref <i>v</i> -refl <i>v</i> -sw <i>v</i> -swl <i>v</i> -type <i>v</i>]</code>	Changes the specifications for the data set <i>d</i> following the syntax from <code>fcreate</code> .
<code>fit <i>array</i></code>	Performs iterative fitting using parameters given in the array <i>array</i> as described in the text.
<code>fplot2d <i>d</i> <i>name</i> (-ppm -ps) [<i>scale</i>]</code>	Creates a Postscript (<code>-ps</code>) or portable pixmap (<code>-ppm</code>) bitmap plot of a 2D data set <i>d</i> using conventional 2D plotting conventions, i.e., shift increasing left and down, optionally vertically scaled with <i>scale</i> .
<code><i>r</i>₁₂ dip2dist <i>N</i>₁ <i>N</i>₂ <i>b</i>₁₂/2π</code>	Calculates the distance (in Å) between the nuclei <i>N</i> ₁ and <i>N</i> ₂ based on the dipolar coupling constant <i>b</i> ₁₂ /2π.
<code><i>b</i>₁₂/2π dist2dip <i>N</i>₁ <i>N</i>₂ <i>r</i>₁₂</code>	Analogous to <code>dip2dist</code> but calculates the dipolar coupling constant in hertz from the distance <i>r</i> ₁₂ (in Å).
<code>list csapar δ₁₁ δ₂₂ δ₃₃</code>	Returns the isotropic shift, chemical shift anisotropy, and the asymmetry parameter assuming unordered principal elements (in hertz or ppm) as arguments.

TABLE 2—Continued

<i>list</i> csaprinc δ_{iso} δ_{aniso} η	Returns the ordered principal elements δ_{xx} , δ_{yy} , and δ_{zz} given the isotropic shift, chemical shift anisotropy, and the asymmetry parameter (in hertz or ppm) as arguments.
<i>list</i> isotopes	Returns a list with data for the spin isotopes available.
<i>value</i> gamma N	Returns the magnetogyric ratio of a nucleus N given in the unit $10^7 \text{rad}/(Ts)$.
<i>value</i> resfreq N [$ \omega_0/2\pi $]	Returns the value of the absolute resonance frequency in hertz for a nucleus N assuming an absolute proton resonance frequency of 10^6 Hz (default) or optionally $ \omega_0/2\pi $ Hz.

Tcl language constructs

<i>name</i> <i>arg</i> <i>arg</i> ...	Function call with arguments.
set <i>var</i> <i>value</i>	Sets a variable to a value.
array(<i>var</i>)	A variable in an associative array.
{ ... }	Begin and end of a command block.
\	Continuation of a line.
<i>Svar</i>	Gets a value of a variable.
[<i>expr</i> <i>expression</i>]	Evaluates a mathematical expression.
proc <i>name</i> { <i>args</i> } { <i>body</i> }	Definition of a user procedure.
global <i>var</i> <i>var</i> ...	Make variables visible outside the current block.
for { <i>start</i> } { <i>test</i> } { <i>incr</i> } { <i>body</i> }	A for loop.
if { <i>test</i> } { <i>body</i> } elseif { <i>test</i> } { <i>body</i> } else { <i>test</i> } { <i>body</i> }	An if construct.
[list <i>e</i> ₁ <i>e</i> ₂ ...]	Creates a list with elements <i>e</i> _{<i>i</i>} .
[lindex <i>Slist</i> <i>i</i>]	Returns element <i>i</i> from a list (counting from zero).

^a All values are in hertz, microseconds, and degrees if not specified otherwise. Arguments in square brackets are optional.^b The parameter can be given in ppm (δ value) by appending a p to the value.^c The *order* parameter for the quadrupolar interaction can be 1 or 2 corresponding to first and second order, respectively, according to Eq. [10].^d For half-integer quadrupolar nuclei *lic* may be applied to excite and detect only the $\{1/2, -1/2\}$ central transition.
